Transcriber's Office
FLOOR DEBATE

March 20, 2001 LB 827

North Platte, Scottsbluff. We have, of course, Omaha and Lincoln and many of our local medical providers and hospitals find it extremely helpful if they can transmit a large volume of information, including x-rays, scans and things like that, via telecommunications to another expert or to a specialist for an opinion. So it is just extremely practical and helpful. We've also seen, in the educational field, a rapid expansion of long...of distance learning capabilities. Many of our schools, as they find it difficult to find and to be able to afford a qualified teacher in certain subjects, particularly foreign languages and particularly mathematics and some of the sciences where we have probably the most shortage and the greatest competition with private industry, they have found distance learning to be a way for them to economically and efficiently bring in that class or that instructor, and we have made fairly good progress in that area. Nebraska doesn't have to apologize or take a back seat for our capabilities in distance learning. The job is not done. Later on in the session, hopefully, we'll get to Senator Kremer's priority bill and that will enhance and help finish the project of distance learning. How does this have anything to do with LB 827? It has everything to do with LB 827. As we try to develop those...those techniques and distance learning and economic development possibilities, businesses doing "e-business", it is essential that we have the capability, where needed, of providing broadband, high-speed telecommunications. The old, slow Internet just isn't up to providing the necessary service for those kinds of jobs. Now, as we headed into this to try to see what we could do, if anything, to help enhance the availability of broadband in Nebraska, we first took a look at our own resources that we have and we have found that we do have the ability of high-speed telecommunications in a large part of Nebraska, particularly where we have a higher population. The population centers, many of them do have pretty good access. However, we also found that we had some resources that maybe weren't being fully used or that were there if we could figure out a way to use them, and in particular I'm talking about dark fiber that might be owned and controlled by our public utility companies, our power districts, our municipally owned electrical systems. Some of those entities have, in the construction of their internal communications and the laying of fiberoptic cable, have provided
